

PINPOINT.

for Hyperion Enterprise®

PinPoint® for Hyperion Enterprise® is a software utility used exclusively with Hyperion Enterprise® 5.5 or higher by administrators, advanced users and consultants. PinPoint will help analyze Enterprise metadata by utilizing pre-defined reports combined with various selection criteria options to isolate the information needed. By making this information easily available in a readable format, the user can quickly identify issues with their application setup and therefore give more integrity to the final output of Enterprise.

Benefits

Assist with Sarbanes-Oxley Compliance. By having the ability to track metadata changes.

Reduce Month-End Close Time. By having the ability to determine metadata inconsistencies quickly.

Ensure Data Accuracy. By being able to easily analyze the details of your metadata.

Minimize Audit Exposure. By having a means to verify and validate your security setup.

Functionality

Identify application inefficiencies. By using one of the **unassigned element flag within reports** in PinPoint, it is easy to identify those elements that are not being used within the application.

Discover the impact of upcoming application changes. PinPoint can identify through the **use reports** where certain application elements are being used within the application.

Determine the reasons for data tie-out discrepancies. The **Organization Compare Report** can identify if a base or parent Entity is missing for a particular Organization. The **Repeated Entities – by Organization Report** can identify Entities that occur in an Organization more than once.

Provide general documentation of the application. Each module within PinPoint contains **inventory reports**. These reports provide a quick list of all elements and their attributes within the application. This can be an easy way to document the current setup of an application.

Identify metadata changes. With the **Application Element Comparison Report**, there is the ability to compare what has changed in the application as often as an extract has been completed.

Verify and Validate the Security Setup. By utilizing the **Security Effective Rights Matrix**, the effective rights of any user or group by security class can easily be identified.

Features

Ease of Use. The user interface uses Microsoft Windows® standards and categorizes the reports utilizing the modules defined within Enterprise (i.e., Category, Account, Entity, etc.).

Metadata Filtering. For each report there are many options to choose from to narrow down the information needed.

Output Options. The reports can be sent to a printer or a file in MS Word®, MS Excel®, Adobe Acrobat® (.PDF) or ASCII format.

Supports Multiple Applications. PinPoint can hold many applications – so a report can be for one application, then easily switch to another application and run that same report.

Backup of Metadata. By holding the PinPoint extract files in a directory under PinPoint – these extracts can be used as a backup of the applications' metadata.

To get more information about PinPoint, download the Demo Mode version of PinPoint, see an online demo, and/or setup a custom webcast demo go to our website at www.EthxTech.com. Or, simply email any questions to info@EthxTech.com.
